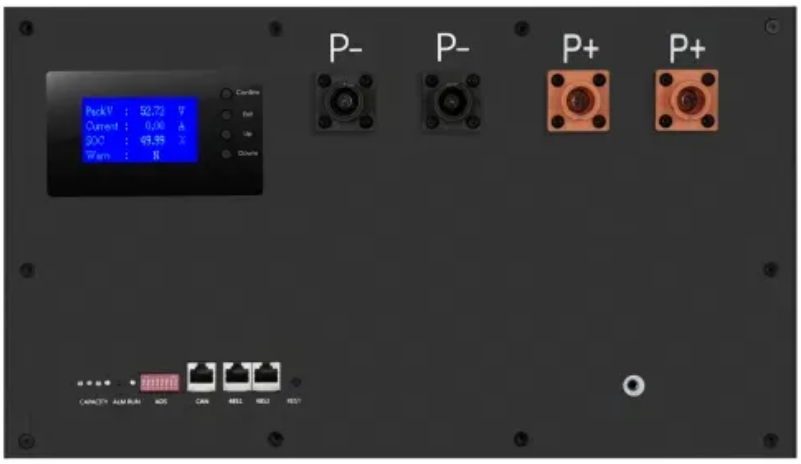
5g base station backup power supply parameters



Overview

Given the backup power sharing scenario in Sect. 4.3.3 and illustrated by Fig. 4.4, two types of power outages may happen.

To keep the network reliability, we need to control the possibility of network failures caused by asynchronous outages under a predefined threshold (denoted by □□).

Further practical constraints during the backup power deployment are as follows. 1. No BS misses: for any BS, its backup power is supplied by the batteries at one.

Note that among the above mathematical representations, only x and yare unknown variables that need to solve, and all the other nations are either prior.

What factors affect the energy storage reserve capacity of 5G base stations?

This work explores the factors that affect the energy storage reserve capacity of 5G base stations: communication volume of the base station, power consumption of the base station, backup time of the base station, and the power supply reliability of the distribution network nodes.

Can 5G base station energy storage be used in emergency restoration?

The massive growth of 5G base stations in the current power grid will not only increase power consumption, but also bring considerable energy storage resources. However, there are few studies on the feasibility of 5G base station energy storage participating in the emergency restoration of the power grid.

Why are 5G base stations important?

The denseness and dispersion of 5G base stations make the distance between base station energy storage and power users closer. When the user's load loses power, the relevant energy storage can be quickly controlled to participate in the power supply of the lost load.

Why do base stations have a small backup energy storage time?

Base stations' backup energy storage time is often related to the reliability of power supply between power grids. For areas with high power supply reliability, the backup energy storage time of base stations can be set smaller.

How to determine backup energy storage capacity of base stations?

For the determination of the backup energy storage capacity of base stations in different regions, this paper mainly considers three factors: power supply reliability of the grid node where the base station is located (grid node vulnerability), the load level of the grid node and communication load.

Is backup energy storage time a constant?

In the research, relevant scholars often regard the backup energy storage time of the base station as a constant [22, 23], and only consider the variability of the base station power consumption. Base stations' backup energy storage time is often related to the reliability of power supply between power grids.
