

## SolarInvert Energy Solutions

# Base station network communication chip

## Overview

---

What is a 'base station on a chip'?

EdgeQ is sampling what it calls a “base station on a chip” that handles high-PHY through baseband. CEO Vinay Ravuri explains its architecture in a video. Figure 1. EdgeQ 5G PHY software brings 5G RAN functions to the company’s “base station on a chip.” Wireless telecom networks need small cells to bring mmWave signals to fruition.

What are 5G base station chips?

5G base station chips play a critical role in the construction of 5G networks. As technology continues to advance, base station chips will demonstrate higher performance and provide support for the comprehensive coverage of 5G networks. At the same time, the market demand for these chips creates new development opportunities for related industries.

What makes a good base station chip?

Base station chips must be capable of efficiently transmitting large amounts of data in high-frequency bands, ensuring large bandwidth support, especially in terms of the performance of radio frequency front-end chips, signal processing capability, and interference suppression. 2.Low Latency and High Connection Density.

What are the technical requirements for 5G base station chips?

As core components, 5G base station chips must meet the following key technical requirements: 1.High Spectrum Efficiency and Large Bandwidth Support 5G networks use a broader range of spectrum resources, particularly the millimeter-wave bands (24 GHz and above).

What is 5G base station-on-a-chip?

EdgeQ’s “ 5G Base Station-on-a-Chip ” is based on an unique hybrid architecture where a RISC-V compute complex is responsible for baseband

processing. Our thesis is to enable the ecosystem access to open-source tools to develop on top of our extended RISC-V instruction sets.

What is a 5G base station?

The goal of 5G networks is to achieve ultra-low latency (as low as 1 ms) and large-scale device connections (up to a million devices per square kilometer). Base station chips must support high-density small cell deployments, meet the massive device access demand, and emphasize high processing speeds and scheduling capability.
