# **Energy storage duration and cost**

## Overview

---

How long does an energy storage system last?

The 2020 Cost and Performance Assessment analyzed energy storage systems from 2 to 10 hours. The 2022 Cost and Performance Assessment analyzes storage system at additional 24- and 100-hour durations.

Which energy storage option is most cost-effective?

The application analysis reveals that battery energy storage is the most cost-effective choice for durations of <2 h, while thermal energy storage is competitive for durations of 2.3–8 h. Pumped hydro storage and compressed-air energy storage emerges as the superior options for durations exceeding 8 h.

How long does thermal energy storage last?

Similarly, in region 2 (storage duration is approximately 3–38 h), thermal energy storage has excellent economic performance. Batteries are competitive until 2.3 h and thermal storage is superior in a range of about 2.3 to 7 h. 4. Conclusion.

Is thermal energy storage a cost-effective choice?

Sensitivity analysis reveals the possible impact on economic performance under conditions of near-future technological progress. The application analysis reveals that battery energy storage is the most cost-effective choice for durations of <2 h, while thermal energy storage is competitive for durations of 2.3–8 h.

Will energy storage costs decrease in the future?

As the energy storage market continues to expand, the costs of both short- and long-duration storage are expected to steadily decrease in the future owing to economies of scale and learning curves. On this account, this subsection analyzes the changes in asset deployment and system economics

resulting from the reduction in storage costs.

How long should solar energy storage be?

This relationship suggests that 6-to-10-h storage is the ideal duration to support the diurnal cycles of solar power. In wind-dominant scenarios, 6-to-10-h storage is replaced by 10-to-20-h storage that appears better suited to support wind-dominant grids.
