

SolarInvert Energy Solutions

Kiribati double glass module processing factory

Overview

What is a double glass module?

Double glass module: the front and back two pieces of glass + photovoltaic cells are compounded by encapsulation film. Traditional double glass module package: EVA+EVA, EVA+POE, POE+POE. Jiaying Fuying double glass module package: PVB+PVB.

What is a glass-glass module?

Glass-Glass module designs are an old technology that utilises a glass layer on the back of modules in place of traditional polymer backsheets. They were heavy and expensive allowing for the lighter polymer backsheets to gain the majority of the market share at the time.

What changes are incorporated in glass-glass modules?

Another major change that is also incorporated for glass-glass modules is swapping EVA for polyolefins as an encapsulant. This is due to the free radicals produced during the cross-linking lamination process of EVA. While traditional backsheets are somewhat permeable to the free radicals, the double-glass module is not.

What is Jiaying Fuying double glass module package?

Jiaying Fuying double glass module package: PVB+PVB. The life cycle is longer, the warranty for ordinary modules is 25 years, and the warranty for double glass modules is 35 years. The attenuation is low, the attenuation of the traditional module is about 0.7%, and the double glass module is 0.5%.

How long will a glass-glass module last?

Therefore, over a 30 year lifetime it can be expected to still operate at 85% of the nameplate capacity. The weight of glass-glass modules are still an issue, with current designs using 2 mm thick glass on each side for framed modules, the weight is about 22 kg, while 2.5 mm on each side will increase the

module's weight to 23 kg.

What is the difference between tempered glass and glass-foil modules?

Compared to traditional glass-foil modules, which are about 18 kg, this is a 20% increase in weight. Although there is no standard on glass thickness, in general it is a more complex and expensive process to produce very thin, tempered glass. However, 2.5 mm glass thickness does allow for frameless designs, which can reduce costs dramatically.
