

Outdoor power supply modeling

Overview

Can digital models be used for power flow analysis of railway power supply systems?

The article presents the results of research aimed at developing digital models for power flow analysis of railway power supply systems (RPSS) equipped with distributed generation (DG) units based on renewable energy sources.

How traction power supply system works?

The wind turbines are meshed with the grid and network sent power to locomotives of traction line connected by their substation. The behavior of Traction power supply system has been analyzed using simulation to check the performance parameter of both systems.

How can RPSSs power flow analysis be applied?

The first one was designed for power flow analysis RPSSs with DG units based on synchronous generators driven by mini-HPP turbines. It is also possible to apply this model in the case of inverter generation that uses photovoltaic panels. The second group of models provided simulation of RPSS power flows with induction generators.
