# Spanish wind solar and energy storage prices

## Overview

---

Is wind power a good source of electricity in Spain?

Some of these data are still provisional so they may vary somewhat when they become definitive, but they will be small changes that will not affect the overall picture. As Red Eléctrica itself announced in December, wind power is once again the leading source of electricity generation in Spain with 23%.

Does Spain still generate more electricity from renewable sources?

Spain continues to generate more electricity from renewable sources as its renewable share of electricity rose to 50.8 percent in 2023 from 42.2 percent in 2022. According to a draft government report issued in June, Spain's goal is to raise the share of renewables to four-fifths by 2030.

Will Spain raise its share of renewables by 2030?

According to a draft government report issued in June, Spain's goal is to raise the share of renewables to four-fifths by 2030. The new climate plan includes higher targets for solar and wind power capacity as well as energy storage.

How long do wind turbines last in Spain?

Every third wind turbine currently operating in Spain was installed before 2005 and the lifespan of wind turbines generating electricity is about 20 to 25 years —far less than the 40 to 60 year life of coal, gas and nuclear plants.

What is the most important source of electricity in Spain?

As Red Eléctrica itself announced in December, wind power is once again the leading source of electricity generation in Spain with 23%. It is followed by nuclear and photovoltaic continues its unstoppable rise and is already the third most important source.

Will Spain double wind power by 2030?

Over half of Spain's electricity was generated from renewable energy in 2023, and a new government proposal sets a goal of 80 percent by 2030 at a cost of \$322 billion. Spain's new government goal to double wind capacity means it would need to almost triple wind installations from current annual rates.
