The difference between inverter high frequency and industrial frequency

Overview

What is the difference between low frequency and high frequency inverters?

Low-frequency Inverters are designed to handle high-surge loads, typically 2-5 times their rated power output. This makes them perfect for refrigerators, compressors, or air conditioners requiring extra power during startup. High-frequency inverters typically have 1.5-2 times their rated power, which limits their surge capacity.

What is a high frequency inverter?

The large majority of inverters available in the retail market are high frequency. They are typically less expensive, have smaller footprints, and have a lower tolerance for industrial loads. HF inverters have over twice the number of components and use multiple, smaller transformers.

What is a frequency inverter?

A frequency inverter, also known as a variable frequency drive (VFD), is a device that converts fixed frequency AC to variable frequency AC. It is based on traditional principles of analog circuit design and uses components like thyristors (SCR), IGBTs, and transformers. Its operating frequency can be adjusted, typically from 0 to 50Hz.

What is a low frequency inverter?

Low-frequency inverters are known for their durability and ability to handle high surge loads. The heavy transformers inside these inverters allow them to deliver much power for short bursts, which is essential for starting devices like refrigerators, air conditioners, or power tools that need extra energy to start running.

Should you buy a high-frequency inverter?

On the other hand, if you're looking for a portable solution for RVs, boats, or small solar setups, a high-frequency inverter is ideal for powering lighter

loads, such as laptops, LED lights, and small electronics.

Does a high frequency inverter need a battery converter?

A high-frequency inverter will typically have a separate battery voltage converter configured. When the mains power is normal, the battery converter reduces the bus voltage to 800V. In case of mains failure or overrun, the battery pack voltage converter raises the high bus voltage to 800V.
