Uninterruptible Power Supply System Design in Tanzania

LFP 280Ah C&I

Overview

What is an uninterruptible power supply?

An uninterruptible power supply is a device that has the ability to convert and control direct current (DC) energy to alternating current (AC) energy . UPS is a battery backup for PC, when the power goes off the UPS kicks in and continues to supply power for some period of time to the particular system.

What is an uninterrupted power supply (UPS)?

The human desire to have a steady power supply for domestic and industrial purposes gave rise to an uninterrupted Power supply (UPS). Globally, the need and demand for computers, electronics, and other electrical devices are on the rise. These types of equipment required quality, high stability, and uninterrupted power supply.

What is a dynamic uninterruptible power supply (Dups)?

For larger power units, Dynamic uninterruptible power supply (DUPS) are sometimes used, a synchronous motor/alternator is connected on the mains via a choke. Energy is stored in a flywheel, when the mains supply fails; an eddy-current regulation maintains the power on the load as long as the flywheels energy is not exhausted.

What happens if a power supply fails?

Interruptions in power supply may cause the contents of the memory to be lost or corrupted, the entire system to malfunction or fail, or even variety of component's failures to occur, all of which not only results in inconveniences but also loss of money. Why UPS?

There is rising pressing need for a continuous quality power supply.
