Use electric fans to cool photovoltaic inverters

Overview

Do solar inverter cooling fans make a difference?

In general, the bigger the solar inverter system, the more (and bigger) cooling fans you'll find. Solar inverter cooling fans are mechanical by nature and subject to wear and tear. Sealed bearings inside the BLDC cooling fans contain grease which dissipates over time, slowing the fan speed, which in turn creates additional heat and noise.

What is a PV inverter cooling fan?

The PV inverter cooling fan is one of the critical auxiliary equipment in the photovoltaic power generation system. Given the large power of the current centralized solar inverter, forced air cooling is usually used.

Do solar inverters use forced air cooling?

At present, most of the mainstream single-phase inverters and three-phase inverters below 20kW on the market use the natural cooling method. Forced air cooling is mainly a method of forcing the air around the device to flow by means of a solar inverter cooling fan, so as to take away the heat emitted by the device.

Do solar inverter cooling fans need a high IP rating?

The IP rating of the solar inverters is relatively high, and most solar inverter cooling fans need a high IP rating as well, at the same time, try to ensure a compact structure, energy-saving, and environmental protection. Here are some suitable cooling fans which mostly chosen by solar manufacturers for the solar inverter cooling:.

Which cooling system is best for a centralized photovoltaic inverter?

for centralized photovoltaic inverters of 100KW-1MW, forced air cooling is generally used; for string inverters with power less than 20KW, The best price/performance ratio is the use of natural cooling. When more than 25KW,

forced air cooling is the more economical way.

What are the cooling technologies of inverters?

At present, the cooling technologies of inverters include natural cooling, forced air cooling, and liquid cooling. The main application forms are natural cooling and forced air cooling.
