Which type of energy storage battery has the best cost performance

Overview

Which battery energy storage technology has the lowest annualized value?

- On an annualized basis, Li-ion has the lowest total annualized \$/kWh value of any of the battery energy storage technologies at \$74/kWh, and ultracapacitors offer the lowest annualized \$/kW value of the technologies included. An attempt was made to determine the cost breakdown among the various categories for PSH and CAES.

How much does a battery cost?

Given the nature of these storage assets, an energy capacity-based cost comparison is used as opposed to a power-based one. The results show that the Li-ion battery has the lowest total annualized \$/kWh cost at approximately \$74/kWh of any of the battery energy storage technologies. This is followed by zinc-hybrid cathode technology at \$91/kWh-yr.

What are the most cost-effective energy storage technologies?

Overall, on a \$/kWh basis, PSH and CAES are the most cost-effective energy storage technologies evaluated within this report. Energy storage technologies serve a useful purpose by offering flexibility in terms of targeted deployment across the distribution system. Pathways to lower the \$/kWh of the battery technologies have been defined.

How are battery energy storage costs forecasted?

Forecast procedures are described in the main body of this report. C&C or engineering, procurement, and construction (EPC) costs can be estimated using the footprint or total volume and weight of the battery energy storage system (BESS). For this report, volume was used as a proxy for these metrics.

Which battery is best for a Bess?

Today, for a BESS with an E/P ratio of 4.0, Li-ion batteries offer the best option in terms of cost, performance, calendar and cycle life, and technological

maturity. PSH and CAES, at \$165/kWh and \$105/kWh, respectively, give the lowest cost in \$/kWh if an E/P ratio of 16 is used inclusive of BOP and C&C costs.

How much does a battery chemistry cost?

A fixed O&M cost of \$10/kW-yr was used for all battery chemistries. Variable O&M includes all costs necessary to operate the storage system throughout the duration of its economic life and is normalized with respect to the annual discharge energy throughput.
