Product Model
HJ-ESS-215A(100KW/215KWh)
HJ-ESS-115A(50KW 115KWh)

Dimensions
1600*1280*2200mm
1600*1200*2000mm

Rated Battery Capacity
215KWH/115KWH

Battery Cooling Method
Air Cooled/Liquid Cooled

ENERGY STORAGE SYSTEM

Overview

What happens inside a battery?

Simply put, batteries transform chemical energy into electrical energy, but what happens inside them is more fascinating than you might think. Batteries work by converting chemical energy into electrical energy. They consist of two electrodes—the anode and the cathode—and an electrolyte that allows ions to move.

How do batteries store energy?

Batteries and similar devices accept, store, and release electricity on demand. Batteries use chemistry, in the form of chemical potential, to store energy, just like many other everyday energy sources. For example, logs and oxygen both store energy in their chemical bonds until burning converts some of that chemical energy to heat.

How do batteries convert chemical energy into electrical energy?

Batteries convert chemical energy into electrical energy through electrochemical reactions between two electrodes: the anode and cathode. The anode undergoes oxidation, releasing electrons, while the cathode undergoes reduction, accepting electrons.

Can you store electricity in a battery?

“You cannot catch and store electricity, but you can store electrical energy in the chemicals inside a battery.” There are three main components of a battery: two terminals made of different chemicals (typically metals), the anode and the cathode; and the electrolyte, which separates these terminals.

What happens if a battery runs out of reactants?

If the battery is disposable, it will produce electricity until it runs out of reactants (same chemical potential on both electrodes). These batteries only work in one direction, transforming chemical energy to electrical energy. But

in other types of batteries, the reaction can be reversed.

How do batteries generate electricity?

Batteries generate electricity through chemical reactions between the anode and cathode that create a flow of electrons. As you use the battery, the electrolyte helps ions move between these two electrodes, balancing the electron flow in your device.
