

## SolarInvert Energy Solutions

# P2G Energy Storage Project

## Overview

---

Power to Gas (PtG) processes have appeared in the last years as a long-term solution for renewable electricity surplus storage through methane production. These promising techniques will play a significant role in the future.

What is power-to-gas (P2G) technology?

While still in its infancy, power-to-gas (P2G) technology is one of the few viable options for large-scale energy storage solutions. Converting excess renewable energy into methane allows storing high energy amounts for a long time in existing gas infrastructures.

Can P2G technology be used for distributed energy system management?

A novel storage service mode is proposed combining P2G technology with microgrids. Optimization models are tailored for distributed energy system management. Nash bargaining based-model reformulation is used for fair benefit distribution. The performance is investigated focusing on the full recovery of solar power.

What is power2gas (P2G)?

[Power2Gas (P2G) uses surplus renewable energy to convert water to hydrogen ('green hydrogen') with electrolysis (as the first step in the P2G process). The gas can then undergo methanation, to create synthetic natural gas (bio-SNG - 'green methane').

What are the advantages of P2G technology?

The hydrogen can be used as a chemical feedstock in industrial sectors, fuel in transportation sectors, or converted back into electricity via gas generators, making it a versatile option for achieving deep emission reduction. P2G technology has several advantages: 1). It produces almost zero emissions, with oxygen as the only by-product, 2).

What is a multi-energy facility operation & P2G investment scheme?

Multi-energy facility operation and P2G investment and operation schemes are

obtained. Energy, economic and environmental analysis is then performed, including total economic benefit and benefit distribution, surplus renewable electricity, etc. 3. Mathematical model.

Where is P2G based?

The largest currently operational P2G project, is located in Werlte, Germany. The plant was designed and built by Etogas for Audi and has a capacity of 6MW. The plant uses renewable power to produce hydrogen which is then combined with CO<sub>2</sub> (from a neighboring biogas plant - Germany has 8000 biogas plants) to produce methane.
