Photovoltaic inverter changes

Overview

What is the global solar PV inverter market like in 2023?

Global solar PV inverter* shipments grew by 56% in 2023 to 536 GWac, with China accounting for half of all shipments as the country's solar demand doubled in 2023, according to the latest analysis by Wood Mackenzie. The top 10 PV inverter vendors, led by Chinese giants Huawei and Sungrow, controlled 81% of the global market.

Why do PV inverters lose power?

The power loss of a PV inverter is mainly caused by the switching and conduction loss of Si devices. To further increase the efficiency of PV inverters, the performance of Si devices is limited, and the emerging SiC devices with less loss should be employed. Fig. 1. Statistical efficiency of commercial PV inverters. 2.1.2. Power density.

How efficient are commercial PV inverters?

Statistical efficiency of commercial PV inverters. 2.1.2. Power density The weight-based and volume-based power densities of PV inverters are 0.1–0.4 kW/kg and 0.05–0.2 kW/L, respectively, as shown in Fig. 2 . The inverters for electric vehicle (EV) applications have significantly higher power densities than others.

Why are inverters important for solar energy?

With the continuous decrease in the cost of photovoltaic (PV) modules and inverters, solar energy has become a competitive source of renewable energy . To integrate PV modules into the utility, inverters are inevitable. The inverter influences the efficiency, economic, and stability issues of a PV-based generation unit .

Does efficiency affect cost-oriented energy loss of PV inverter?

For the third class area, the on-grid price is high. If the efficiency of an inverter

for third class area is less than 96%, the energy loss will more than the investment cost of the inverter during the lifetime of the inverter. Fig. 6. Relationship between efficiency and cost-oriented energy loss of PV inverter.

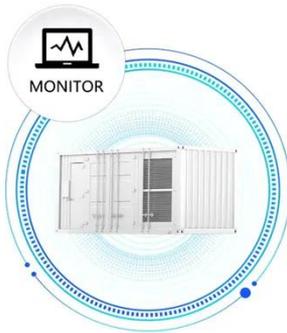

2.2.2. High power density.

How long do PV inverters last?

For reliability, the statistical failure rate and designed life expectancy of PV inverters are 0.9/year and 15 years, respectively . The inverters is generally considered one of the weakest points in a PV generation system. The output power of a PV module fluctuates and is random.
