

## SolarInvert Energy Solutions

# Solar irrigation system programmable

## Overview

---

Can a solar-powered irrigation control system be used autonomously?

Given the growing need for sustainable agriculture practices, the development of a solar-powered smart irrigation control system kit holds immense promise. By harnessing solar energy, this kit can operate autonomously, reducing dependence on conventional energy sources and minimizing operational costs for farmers.

Can SPM improve access to solar-powered irrigation?

These farms require large solar power systems, which are cost prohibitive in LMICs, when designed and operated using traditional methods. Implementing SPM in these contexts could increase the accessibility of solar-powered irrigation. The proposed POWElr controller implements SPM and optimizes SPDI energy and water use.

Can solar-powered drip irrigation increase agricultural productivity?

Solar-powered drip irrigation (SPDI) is a potential solution that could sustainably increase agricultural productivity . Solar power is a carbon emission-free solution that is particularly feasible in arid, water-stressed regions with high solar irradiance , , .

How do solar-powered irrigation systems work?

When the moisture level rises above this threshold, the system stops the motor. Solar-powered irrigation systems represent a recent innovation in sustainable agriculture and environmental sustainability. They contribute to water conservation and improve irrigation efficiency, enhancing field productivity and reducing natural resource consumption.

How reliable is a solar irrigation controller?

On the tested above-average demand days, the controller was shown to have up to 46% higher solar irrigation reliability. Even with solar prediction errors of

up to 0.9 NRMSE, the controller was able to deliver irrigation more reliably while using less energy storage buffer compared to the SSO reference.

How does a SPM irrigation controller work?

The controller produces an optimal SPM irrigation schedule for a SPDI system, taking into account the available solar power, the required pumping power, the irrigation demand, and the battery capacity. The aims are to maximize crop yield, manage energy efficiently, minimize water use, and reduce risk to farmers.
